

Lupus Erythematosis (SLE)

It is a connective tissue disease, also referred to as Collagen disease. The disease may initially appear as Arthritis. The treatment requires steroids. Concern about residual problems related to steroids and kidney involvement are of great concern. There are two types of Lupus: Discoid and Systemic. Discoid is the milder form and in many cases can be issued STD. Systemic as you should have guessed is more significant. The usual range is T 4 - 8 depending on duration, current symptoms, and progression of the disease. The applicant will provide a great deal of info, but an APS will be needed for details of the disease process.
